# Gradient opacity in Uyghur backness harmony: A large-scale corpus study

**Connor Mayer** University of California, Irvine

**29mfm 2022** cjmayer@uci.edu | www.connormayer.com

- These zones require **lexical knowledge** of harmony class

If we treat **opacity** as another **zone of variation**, we can model it using the same mechanisms!

hether they display opaque iction and backness harmony. frequency and other properties.

d for by modeling opacity as a knowledge of the harmonizing phonotactic constraints.

# ethodology

Uyghur newspapers (~15m words).

entify root and detect suffix

n><px2sg><frm><<a href="mailto:dat-b">dat-b</a>

# results

opacity (43,450 tokens) 'custom', /sij<u>a</u>s<u>æ</u>t/ 'politics' 'cheap' /kæsipdo/ 'colleague'

ut a number of roots (*n*=53) **vary** 

ses: [<mark>aha</mark>li-l<u>æ</u>r-<u>gæ]</u> ses: [ahali-lar-ka]

me for details) likely to harmonize opaquely

rms more frequently are more

o show surface harmony (Vaux 2000)

# ges and proposal

cannot model this variability ez-Otero 2003) would require

unexpected!

**Proposal:** Uyghur backness harmony has **zones of variation** (Hayes 2016) harmony only semi-predictable from phonological properties of roots

<u>Maximum entropy optimality theory with indexed constraints</u> (e.g., Pater 2009, Moore-Cantwell and Pater 2016, a.o.). Indexed constraints mandate front/back allomorphs

/s <mark>ahabæ</mark> -IAr/	Pred. freq.	VAgree Back w=4.7	VAgree Front w=10.4	Harmonize Backsahabe w=2.7	Harmonize Front <sub>sahabe</sub> w=7.1	*Unraised w=24.8

sahabæ-lar	0		1			1

HARMONIZE weighted by **speaker certainty** of harmonic class

e.g., HarmonizeBackx  $\propto$ 

## <u>Components</u>

- 2016, Breiss 2021)

Treating opacity as a consequence of lexical listing of morphological class lets us capture it in a parallel model • Unifies it with other zones of variation in Uyghur • Straightforward to model variability and the influence of frequency-based effects (cf. Coetzee and Kawahara 2013)

Uyghur backness harmony has a **dual life** as a phonological process and a morphological class system • Like grammatical gender, but with strong predictability from phonotactics (cf. Becker and Dow 2013, Kupisch et al. 2022) • Similar to proposal for Hungarian (Rebrus & Törkenczy 2017)

**Future work:** More colloquial corpora; experimental validation; further refine properties of model **Selected References**

### 7. Phonological modeling

• Phonological constraints mandate surface harmony

• Most of the time these agree, but in opaque forms they don't!

P(HC=back|x)

**Phonotactic probability** based on UR that x is a back harmonizer, weighted by root activation (cf. Becker and Gouskova

**Structural knowledge** about *x*'s harmony class • How many times have we seen x with a back suffix?

**Bias** towards back suffixes (default class in Uyghur)

### 8. Discussion

### Statistical analysis

Mixed effects logistic regression model fit to tokens

- <u>Dependent variable</u>: Does token exhibit opaque harmony?
  <u>Fixed effects</u>
- intercept • intercept • log token frequency per million words ( $\beta$ =0.51, z=2.87, p < 0.005) • proportion of tokens that are raised ( $\beta$ =-3.25, z=-2.99, p < 0.005) • final vowel identity (reference level æ) ( $\beta$ =-3.94, z=-2.55, p < 0.05) • Random intercepts • Root identity ( $\sigma$ =3.57)
- Root identity  $(\sigma=3.57)$ • Corpus  $(\sigma=1.20)$
